## 1.Introduction

### 1.1 What is Low-Level design document?

The goal of the LDD or Low-level design document (LLDD) is to give the internal logic design of the actual program code for the House Price Prediction dashboard. LDD describes the class diagrams with the methods and relations between classes and programs specs. It describes the modules so that the programmer can directly code the program from the document.

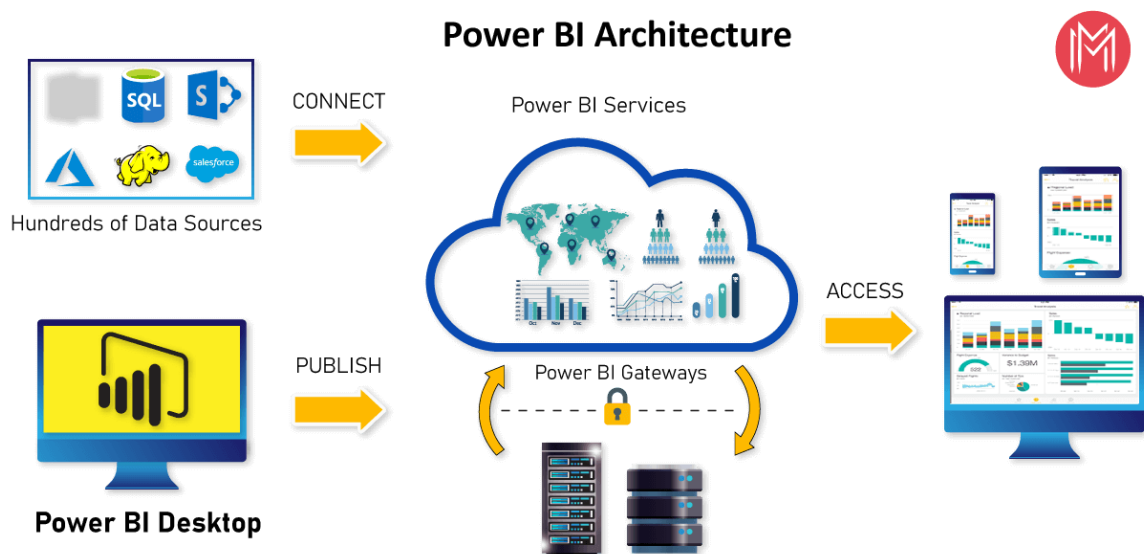

### 1.2 Scope

Low-level design (LLD) is a component-level design process that follows a step-by-step refinement process. The process can be used for designing data structures, required software architecture, source code and ultimately, performance algorithms. Overall, the data organization may be defined during requirement analysis and then refined during data design work.

## 2. Architecture

Power BI is a business suite that includes several technologies that work together. To deliver outstanding business intelligence solutions, Microsoft Power BI technology consists of a group of components such as:

- Power Query (for data mash-up and transformation)
- Power BI Desktop (a companion development tool)
- Power BI Mobile (for Android, iOS, Windows phones)
- Power Pivot (for in-memory tabular data modelling)
- Power View (for viewing data visualizations)
- Power Map (for visualizing 3D geo-spatial data)
- Power Q&A (for natural language Q&A)

### 1. Data Sources

An important component of Power BI is its vast range of data sources. You can import data from files in your system, cloud-based online data sources or connect directly to live connections. If you import from data on-premise or online services there is a limit of 1 GB. Some commonly used data sources in Power BI are:

- Excel
- Text/CSV
- XML
- JSON
- Oracle Database
- IBM DB2 Database
- MySQL Database
- PostgreSQL Database
- Sybase Database
- Teradata Database
- SAP HANA Database
- SAP Business Warehouse server

- Amazon Redshift
- Impala
- Google Big Query (Beta)
- Azure SQL Database
- Salesforce Reports
- Google Analytics
- Facebook
- GitHub

## 2. Power BI Desktop

Power BI Desktop is a client-side tool known as a companion development and authoring tool. This desktop-based software is loaded with tools and functionalities to connect to data sources, transform data, data modelling and creating reports.

## 3. Power BI Service

Power BI Service is a web-based platform from where you can share reports made on Power BI Desktop, collaborate with other users, and create dashboards. It is available in three versions:

- Free version
- Pro version
- Premium version

Power BI Service is also known as, “Power BI.com”, “Power BI Workspace”, “Power BI Site” and “Power BI Web Portal”. This component also offers advanced features like natural language Q&A and alerts.

## 4. Power BI Report Server

The Power BI Report Server is like the Power BI Service. The only difference between these two is that Power BI Report Server is an on-premise platform. It is used by organizations who do not want to publish their reports on the cloud and are concerned about the security of their data. Power BI Report Server enables you to create dashboards and share your reports with other users following proper security protocols. To use this service, you need to have a Power BI Premium license.

## 5. Power BI Gateway

This component is used to connect and access on-premise data in secured networks. Power BI Gateways are generally used in organizations where data is kept in security and watch. Gateways help to extract out such data through secure channels to Power BI platforms for analysis and reporting.

## 6. Power BI Mobile

Power BI Mobile is a native Power BI application that runs on iOS, Android, and Windows mobile devices. For viewing reports and dashboards, these applications are used.

## 7. Power BI Embedded

Power BI Embedded offers APIs which are used to embed visuals into custom applications.

### 3. Architecture Description

#### 3.1 Data Description

The dataset contains one table Customer and Sales data of Amazon for the year 2010,2011,2012, 2013, 2014, 2015, 2016, 2017

##### Amazon Sales Data Features

1. Region
2. Country
3. Item Type
4. Sales Channel
5. Order Priority
6. Order Date
7. Order Id
8. Ship Date
9. Units Sold
10. Unit Price
11. Unit Cost
12. Total Revenue
13. Total Cost
14. Total Profit

#### 3.2 Data Loading

Step 1:- Open Power BI Desktop Application

Step 2:- click on Get Data → Click on excel

Step 3:- Browse to the data file on your system and select

Step 4:- Once Data is loaded click on Transform data in the bottom for further transformation.

### 4. Unit Test Cases

Test Case	Description
Slicer of Year, Country ,Item Type ,Region	Slicer shows a drop down.
KPIs	Units Sold, Revenue, Profit, Cost
Charts	All charts showing 0 error
Tooltips	Tooltips on various page working properly
Page buttons	Page buttons working properly
